FINDING THE TIMES THAT
SMMR OBSERVED A SHIP

FINAL REPORT

FINDING THE TIMES THAT

SMMR OBSERVED A SHIP

Final Report

Contract No. NAS5-25072

July 9, 1979

Prepared For:

Dr. A. T. Chang
National Aeronautics and Space Administration
Goddard Space Flight Center
Greenbelt, Maryland 20771

Prepared By:

Systems and Applied Sciences Corporation
6811 Kenilworth Avenue, Suite 610
Riverdale, Maryland 20840

II. Coordinate Transformation

In order to facilitate the coincidence calculations, the coordinates of the ship and the satellite are transformed to the ECO system, in which the equatorial plane is the plane of the satellite's orbit. The transformation from earth-centered fixed (ECF) to ECO coordinates is shown in Figure 1.

These are the transformation matrices for each step:

$$(1) \quad \underline{\lambda}' = \begin{pmatrix} \cos \alpha_t & -\sin \alpha_t & 0 \\ \sin \alpha_t & \cos \alpha_t & 0 \\ 0 & 0 & 1 \end{pmatrix}$$

where

$$(2) \quad \alpha_t = \alpha_0 + e_{\text{rot}} \cdot (t - t_0)$$

α_0 is the Greenwich hour angle (GHA) of γ , the first point of Aries, at t_0

e_{rot} is the earth's rotation rate

Note: α_t , measured in radians, is the Greenwich sidereal time at Universal Time t .

Step (1) ECF to ECI.

Rotate the equatorial plane by the Greenwich hour angle at time t (U.T.); α_t

Step (2) Rotate ECI coordinates by Ω , the longitude of the ascending node.

Step (3) Tilt the equatorial plane by the inclination of the orbit.

Figure 1

$$(3) \quad \underline{\lambda}'' = \begin{pmatrix} \cos \Omega & \sin \Omega & 0 \\ -\sin \Omega & \cos \Omega & 0 \\ 0 & 0 & 1 \end{pmatrix}$$

$$(4) \quad \underline{\tilde{\lambda}} = \begin{pmatrix} 1 & 0 & 0 \\ 0 & \cos i & \sin i \\ 0 & -\sin i & \cos i \end{pmatrix}$$

The complete transformation is:

$$(5) \quad \underline{\lambda} = \underline{\tilde{\lambda}} \underline{\lambda}'' \underline{\lambda}' = \begin{pmatrix} \cos(\Omega - \alpha_t) & \sin(\Omega - \alpha_t) & 0 \\ (-\cos i) \sin(\Omega - \alpha_t) & (\cos i) \cos(\Omega - \alpha_t) & \sin i \\ (\sin i) \sin(\Omega - \alpha_t) & (-\sin i) \cos(\Omega - \alpha_t) & \cos i \end{pmatrix}$$

The ECO coordinates of the ship are:

$$(6) \quad \begin{cases} X_{orb} = X \cos(\Omega - \alpha_t) + Y \sin(\Omega - \alpha_t) \\ Y_{orb} = \cos i [-X \sin(\Omega - \alpha_t) + Y \cos(\Omega - \alpha_t)] + Z \sin i \\ Z_{orb} = \sin i [X \sin(\Omega - \alpha_t) - Y \cos(\Omega - \alpha_t)] + Z \cos i \end{cases}$$

where X, Y, Z are the ship's ECF coordinates.

III. Calculation of Time Intervals

The ship can be observed when it is in a band about the equator in the ECO system. The width of the band (Z_{lim}) is determined by the scan pattern of the instrument. The first step in obtaining the times the ship enters and leaves the band is to set $Z_{orb} = \pm Z_{lim}$ in (6) and solve quadratic equations for $\cos \alpha_t$ and $\sin \alpha_t$ (see Appendix 1). We need both $\sin \alpha_t$ and $\cos \alpha_t$ so that we can put α_t in the proper quadrant. We then use (2) to calculate the U.T. times the ship is at the borders of the band in an interval of approximately 48 hours centered about the time of the ship's observation. Depending on the ship's latitude, there will be two, three, or four time intervals to be searched for coincidences.

IV. Existence and Times of Coincidence

The work of OTIME is nearly complete after the time intervals have been calculated. It calls LONGIT, which checks for the existence of a coincidence in each interval using the criterion:

$$(\text{lon}_{\text{sat}}(t_1) - \text{lon}_{\text{ship}}(t_1)) (\text{lon}_{\text{sat}}(t_2) - \text{lon}_{\text{ship}}(t_2)) \leq 0 \quad (7).$$

If the time interval is longer than the period of the satellite, LONGIT is restricted to searching the full period closest to the time of ship observation. Furthermore, if the interval is longer than half a period, it is split into three parts in order to avoid a breakdown of (7).

GETTIM uses a modified regula falsi technique to find the time of coincidence. The first step in the procedure uses the normal regula falsi technique. The number of iterations to be done is passed to the coincidence program from the main program. If convergence has not been reached after the iterations have been done, the second step is to determine in which half of the interval the root lies and repeat the first step using that half-interval. The maximum number of times the interval can be halved is also passed from the main program.

If convergence is reached, an empirical correction factor, which depends on the month being processed, is applied to the time of coincidence. The final time of coincidence is

$$t_f = t_c + (t_{\text{corr1}} \cdot t_c + t_{\text{corr2}})/60 \quad (8)$$

where t_c = originally calculated time of coincidence (in hours)

$t_{\text{corr1}}, t_{\text{corr2}}$ = correction factors.

The correction factors are obtained from plotting δt , the error in the calculated SMMR observation time, against Δt , the difference between the time of the ship observation and the SMMR observation time. Points which were observed by SMMR are read from the SMMR TLTs for three or four days spread over the month being processed. These points are fed to OTIME along with several ship observation times. These points fit a straight line whose slope, in minutes per hour, is t_{corr1} and whose δt -intercept is the negative of t_{corr2} .

V. How to Run the Program

The following shows how to use OTIME and describes the output. Unless otherwise noted, all variables listed below are REAL*8.

A. Input to OTIME

ALON, ALAT The position of the ship. Units are degrees. The range of ALON is (0, 360), and it is measured positive to the west. The range of ALAT is (-90, +90).

TLIM In GETTIM, the interval of coincidence is reduced until its length is less than the value of TLIM. A value of .01 minute is recommended.

NITER(I*4) Also used in GETTIM, NITER is the number of iterations to be done before the time interval is halved. A value of 3 is recommended.

NHALF(I*4) The maximum number of iterations is the product of NHALF and NITER. A value of 17 is recommended.

ITSOBS(I*4) The hour (U.T.) of the day at which the ship made the observation. ITSOBS must be in the interval (0,24).

IDAYYR(I*4) The day of the year on which the ship made the observation. Midnight of January 1, 1978 is day 0.0.

LYEAR(I*4) The year in which the observation was made. LYEAR must have 4 digits, i.e., 1978 not 78.

TCORR1 Time correction factors used in GETTIM.
 Units are minutes/hour. TCORR1 is read in
 by the namelist TIME from unit 9.

TCORR2 Time correction factor used in GETTIM. Units
 are minutes. TCORR2 is read by the namelist
 TIME from unit 9.

When OTIME is called for the first time, it reads in TCORR1 and TCORR2 from unit 9, and from unit 11 it reads in a set of orbital elements and other information which enables it to calculate the ECI coordinates of the satellite at any time during the month which is being processed. The following cards must be included in the JCL for the GO step:

```
//GO.FT09F001 DD *
               namelist input
```

and

```
//GO.FT11F001 DD DSN=ZMMHT.ELTS.aaann,DISP=SHR
```

where aaa = first three letters of the month being processed
 nn = last two digits of the year

B. Output from OTIME

TOBS: 4-element time vector containing times of coincidences measured relative to the time of observation (i.e., $t_{\text{obs}} = 0$). Units are hours (U.T.).

IFOBS: 4-element flag vector. If IFOBS(n) = 0, no coincidence occurred, but if IFOBS(n) = 1, a coincidence occurred, and TOBS(n) contains the time.

IERF: Error flag (see Sec. C).

C. Error Conditions

There is one error flag, IERF, which can take several values:

<u>Value of IERF</u>	<u>Condition</u>
a. Error conditions set in OTIME	
0	Normal
1	The elements passed to GKEP violated one of the following conditions: (i) The eccentricity was not in the range (0, 1). (ii) The semi-major axis was not in the range (0, 1×10^{35}).
2	The year in which the observation was made does not match the year for which the orbital elements were read in.
3	Orbital elements were read in for a range of days which does not include the day the observation was made on.
4	The hour of the day is out of range.
5	The latitude of the ship is out of range.
6	The longitude of the ship is out of range.
7	The absolute value of a computed time is greater than 35 hours.

- 8 The time that the ship entered the band is greater than the time it left the band.
- 9 The ship remained in the band for more than one sidereal day.
- 15 One or both of LDAY0 and LDAYF, parameters which point to the first or last days for which orbital elements have been calculated, are out of range, or LDAY0 is greater than LDAYF.
- 16 Orbital elements do not exist for the day given by IDAYYR
- b. Error conditions set in LONGIT.
- 10 Same as 7.
- 11 Same as 8.
- 12 Same as 9.
- c. Error conditions set in GETTIM.
- 13 The differences in longitude between the ship and the satellite have the same sign at both endpoints of the time interval.
- 14 The time of coincidence (U.T.) has an absolute value greater than 30 hours.

NHALF*NITER Convergence was not reached.

If an error is encountered, an error message is printed, control is returned to the main program, and no further processing is done.

D. Common Block

The common block CONST appears in all subroutines except GKEP. The following table lists the variables contained in CONST. They are all computed in OTIME:

X,Y,Z	ECF coordinates of ship.
ALON0	Longitude of satellite in ECO system at time of ship observation.
SREVB	Revolution rate of satellite about the earth in radians per hour (U.T.).
COSI, SINI	Cosine and sine of orbital inclination.
C1, C2	Constants used in calculation of X_{orb} and Y_{orb} (see (6)), and α_t (see App. 1).
T	Eight element vector containing endpoints of time intervals to be searched for coincidences.
TPI	2π .
EROTH	Rotation rate of earth, e_{rot} , in radians per hour (U.T.).
GHA0	GHA at time of ship observation.
TPIE	$2\pi/e_{rot}$
SINOM, COSOM	Sine and cosine of the longitude of the ascending node.
ERSINI	$-e_{rot} \cdot \sin(i)$ where $\sin(i) = SINI$.
PERIOD	Period of satellite orbit as computed by Kepler's third law.
NTIMES	The number of time intervals to be searched for coincidences is NTIMES divided by 2.

E. Calling Sequence

CALL OTIME(ALON, ALAT, TOBS, TLIM, IFOBS, IERF, NHALF, NITER,
ITSOBS, IDAYYR, LYEAR).

Appendix 1. Calculation of α_t

$$(A1-1) \quad (\pm z_{lim} / \sin i) = [x \sin \Omega - y \cos \Omega] \cos \alpha_t \\ - [x \cos \Omega + y \sin \Omega] \sin \alpha_t + z \cot i$$

$$(A1-2) \quad 0 = A \cos \alpha_t - B \sin \alpha_t + C$$

where

$$\left. \begin{aligned} A &= x \sin \Omega - y \cos \Omega \\ B &= x \cos \Omega + y \sin \Omega \\ C &= z \cot i \mp z_{lim} / \sin i \end{aligned} \right\} \quad (A1-3)$$

Let $\sin \alpha_t = \sqrt{1 - \cos^2 \alpha_t}$, then (A1-2) becomes

$$B^2 (1 - \cos^2 \alpha_t) = A^2 \cos^2 \alpha_t + 2AC \cos \alpha_t + C^2$$

$$0 = (A^2 + B^2) \cos^2 \alpha_t + 2AC \cos \alpha_t + (C^2 - B^2)$$

$$\cos \alpha_t = \frac{-2AC \pm \sqrt{4A^2C^2 - 4(A^2 + B^2)(C^2 - B^2)}}{2(A^2 + B^2)}$$

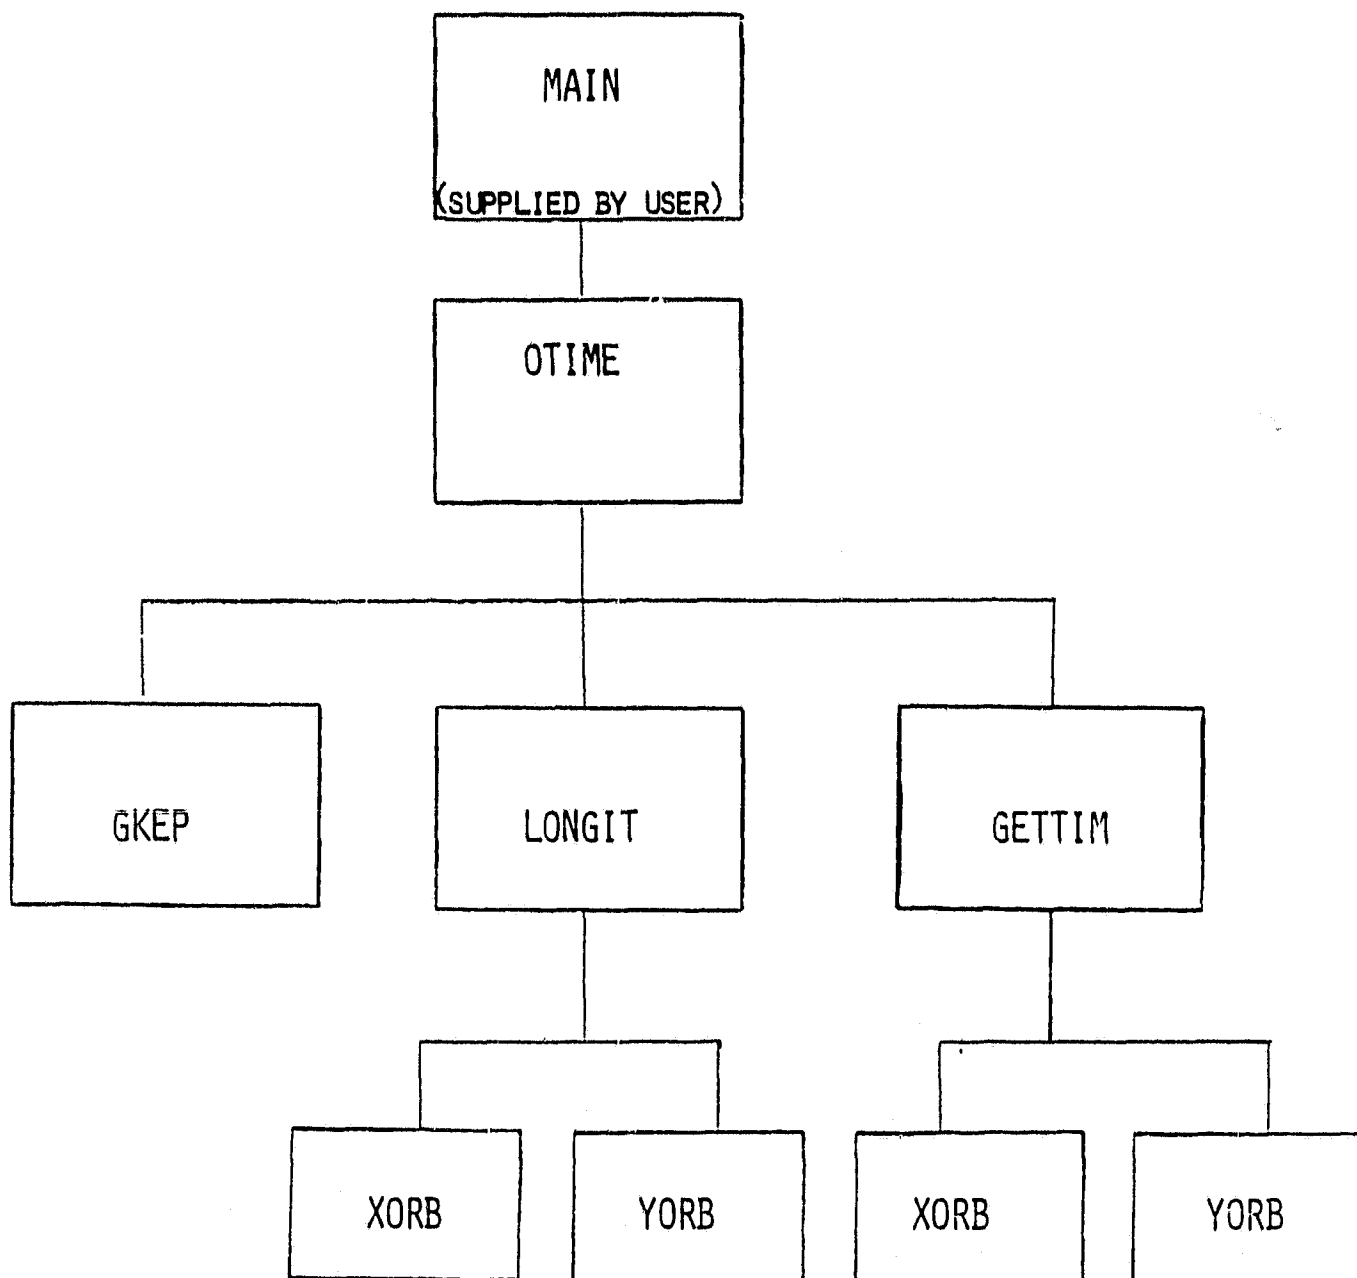

$$\text{Now, } A^2 + B^2 = x^2 + y^2 = D, \quad \text{so}$$

$$\cos \alpha_t = \frac{-AC \pm \sqrt{A^2C^2 - D(C^2 - B^2)}}{D} \quad (\text{A1-4})$$

Now we go back to (A1-2) and set $\cos \alpha_t = 1 - \sin^2 \alpha_t$.

This gives us

$$\sin \alpha_t = \frac{BC \pm \sqrt{B^2C^2 - D(C^2 - A^2)}}{D} \quad (\text{A1-5})$$
